## CS421 Hw11 Brian Ackermann Ackerma9

```
1) Prove (\lambda y.xy)(\lambda x.\lambda y.yx) - \alpha \rightarrow (\lambda z.xz)(\lambda y.\lambda x.xy)
        (\lambda y. xy)(\lambda x. \lambda y. yx) \sim \alpha \sim (\lambda z. xz)(\lambda x. \lambda y. yx)
So (\lambda y. xy)(\lambda x. \lambda y. yx) - \alpha \rightarrow (\lambda z. xz)(\lambda x. \lambda y. yx)
        (\lambda z. xz)(\lambda x. \lambda y. yx) \sim \alpha \sim (\lambda z. xz)(\lambda w. \lambda y. yw)
So (\lambda z. xz)(\lambda x. \lambda y. yx) - \alpha \rightarrow (\lambda z. xz)(\lambda w. \lambda y. yw)
        (\lambda z. xz)(\lambda w. \lambda y. yw) \sim \alpha \sim (\lambda z. xz)(\lambda w. \lambda x. xw)
So (\lambda z. xz)(\lambda w. \lambda y. yw) - \alpha \rightarrow (\lambda z. xz)(\lambda w. \lambda x. xw)
        (\lambda z. xz)(\lambda w. \lambda y. yw) \sim \alpha \sim (\lambda z. xz)(\lambda y. \lambda x. xy)
So (\lambda z. xz)(\lambda w. \lambda y. yw) - \alpha \rightarrow (\lambda z. xz)(\lambda y. \lambda x. xy)
2)
    a) Eager Evaluation
 (\lambda x. x(\lambda y. xy))((\lambda u. u)(\lambda w. w)) \quad (\lambda u. u)[(\lambda w. w)/u)
-\beta \rightarrow (\lambda x. x(\lambda y. xy))(\lambda w. w)
                                                                       (\lambda x. x(\lambda y. xy))[(\lambda w. w)/x]
-\beta \rightarrow (\lambda w. w(\lambda y. (\lambda w. w) y))
    b) Lazy Evaluation
(\lambda x. x(\lambda y. xy))((\lambda u. u)(\lambda w. w)) \quad (\lambda x. x(\lambda y. xy))[((\lambda u. u)(\lambda w. w))/x]
-\beta \to \left( \left( (\lambda u. u)(\lambda w. w) \right) \left( \lambda y. \left( (\lambda u. u)(\lambda w. w) \right) y \right) \right) \quad (\lambda u. u) [(\lambda w. w)/u]
-\beta \to \left(\lambda w. w \left(\lambda y. \left((\lambda u. u)(\lambda w. w)\right)\right)\right) \quad (\lambda u. u)[(\lambda w. w)/u]
-\beta \rightarrow (\lambda w. w(\lambda y. (\lambda w. w)y)
(\lambda x. x(\lambda y. xy))((\lambda u. u)(\lambda w. w)) (\lambda y. xy)[((\lambda u. u)(\lambda w. w))/y]
-\beta \to \left(\lambda x. \left(x \left((\lambda u. u)(\lambda w. w)\right)\right)\right) (\lambda u. u) [(\lambda w. w)/u]
-\beta \rightarrow (\lambda x. x(x(\lambda w. w)))
